

C, C++, DSA in depth

# Application of Pointers

Saurabh Shukla (MySirG)

# Agenda

- ① Pointer's Arithmetic
- ② Call by reference
- ③ Pointers and arrays
- ④ Pointers and strings
- ⑤ Array of pointers
- ⑥ Pointer to array
- ⑦ Wild pointer
- ⑧ NULL pointer
- ⑨ Dangling pointer
- ⑩ Void pointer

- Pointer is a variable
- It contains address of another variable
- Size of pointer is not dependent on its type.
- Pointer jis type ka hota usi type ke variable ko point karta hai
- `int *p;`
- =  $*p \approx$  variable pointed by p

# Pointer's Arithmetic

```
int a, b, *P, *q;
```

```
P=&a;
```

```
q=&b;
```

$P+q$

$P*q$

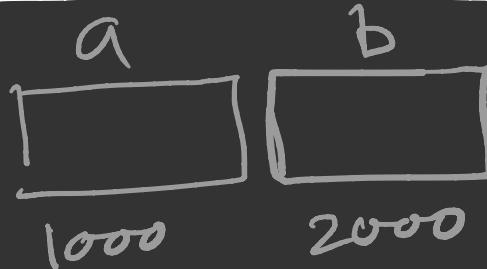

$P/q$

$P*5$

$P/3$

} Error

} Error

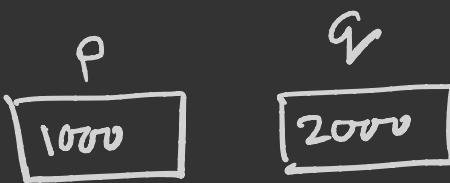

$$q - P \quad 250$$

$$P - q \quad -250$$

$$P + 1 = 1000$$

$$P + 2 = 1001$$

$$P + 4 = 1004$$

$$P + 1 = 1004$$

$$P + 2 = 1008$$

$$P + 5 = 1020$$

$$P + i = \text{base address} + i * \text{size of type of}(P)$$

$$\begin{aligned} P - 3 &= 1000 - 3 * 4 \\ &= 988 \end{aligned}$$

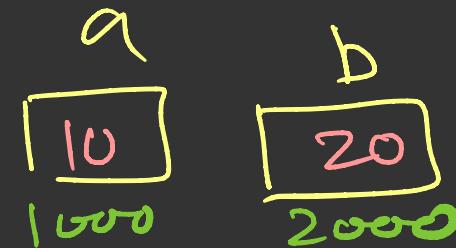

You can subtract address from an address provided they are of same type.

```

int main()
{
    int a,b;
    printf("Enter two numbers");
    scanf("%d %d", &a, &b);
    Swap(&a,&b);
    printf("%d %d", a, b);
    return 0;
}

```

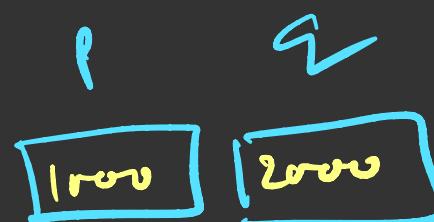

```

void Swap(int *P, int *Q)
{
    int C;
    C = *P;
    *P = *Q;
    *Q = C;
}

```

$*P \approx a$

C  
D

}

## Call by Reference

```
void swap( int *, int * );
int main()
{
    int a, b;
    printf("Enter two numbers");
    scanf("%d %d", &a, &b);
    swap(&a, &b);           ← Call by reference
    printf("%d %d", a, b);
    return 0;
}
```

```
void swap( int *P, int *Q)
{
    int t;
    t = *P;
    *P = *Q;
    *Q = t;
}
```

Formal argument

- ① ordinary variable
- ② pointer variable

Why we use & in scanf() ?

scanf("%d", &x);

# Pointers and Arrays

int a[5]; P  
 int \*p;  
 P = &a[0];

0 1 2 3 4  
 1000 1004 1008 1012 1016

P+0	1000	&a[0]	*(P+0)	a[0]
P+1	1004	&a[1]	*(P+1)	a[1]
P+2	1008	&a[2]	*(P+2)	a[2]
P+3	1012	&a[3]	*(P+3)	a[3]
P+4	1016	&a[4]	*(P+4)	a[4]
P+i		&a[i]	*(P+i)	a[i]

$$a[2] \rightarrow *(\&a + 2) \rightarrow *\&(2+a) \rightarrow 2[a]$$

$$p[2] \rightarrow *(p + 2) \rightarrow *\&(2+p) \rightarrow 2[p]$$

what is the difference between a and p.

p is a variable

p++ ✓

a is constant

a++ ✗

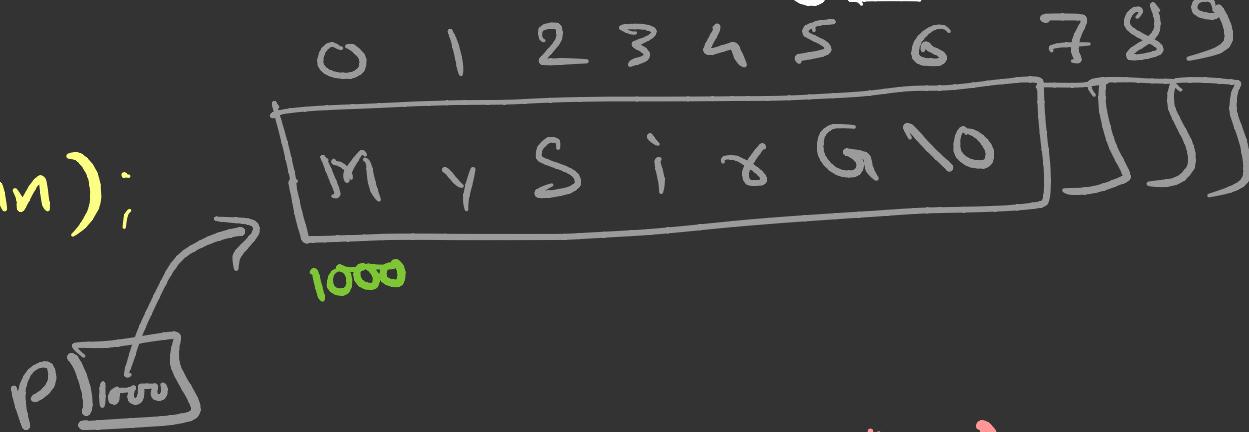

```
int l;
```

```
char str[10];
```

```
fgets(str, 10, stdin);
```

```
l = length(str);
```

## Pointers and Strings

```
int length(char *p)
{
    int i;
    for(i=0; *(p+i); i++);
    return i;
}
```

# Array of Pointers

`int *P[4];`

$P[0][1] X$   
 $*(*P[0]+1) X$

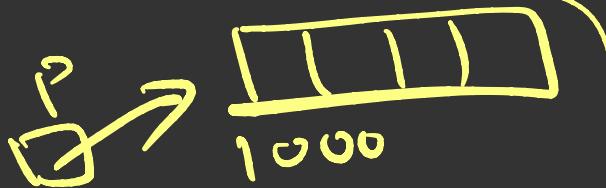

## Pointer to Array

`int (*P)[4];` P is a pointer to an array of int type with 4 blocks.

P+1 = 1016  
P+2 = 1032  
P+3 = 1048  
P+4 = 1064

`int *P;`

P+1 1004  
P+2 1008

```
int (*p)[4];
```

```
int a[5][4];
```

```
p = a;
```

$p+1 \quad 116$

$p+2 \quad 132$

$p+3 \quad 148$

$\underline{p+4 \quad 164}$

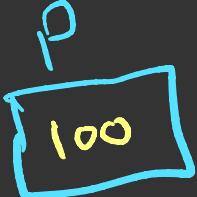

$*140 = 10$

$a[2][2] = 10$

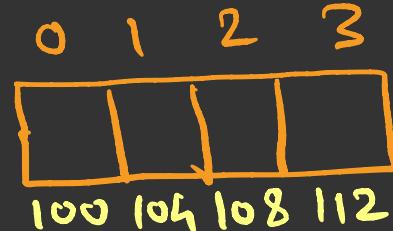

$*(a[2]+2) = 10$

$*(*(a+2)+2) = 10$

$*(*(p+2)+2) = 10$

0

$\rightarrow a[2][2] = 10$

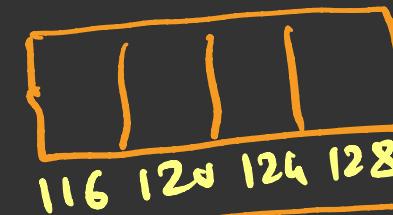

$*(*p+2)[2] = 10$

$*(*(*p+2)+2) = 10$

$*(*(*p+2)+2) = 10$

$p[2][2] = 10$

1

$a[i][i]$   
 $p[i][j]$

## Wild Pointer

An uninitialized pointer is a wild pointer.

```
void f1()
{
    int *P; ← wild pointer
    *P = 5; ← illegal use of pointer
    ...
}
```

## NULL Pointer

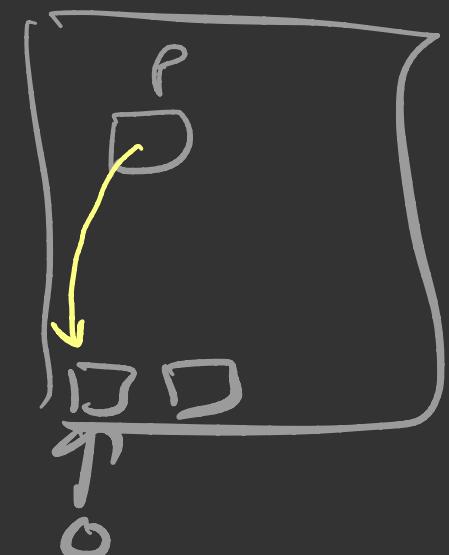

- A pointer containing NULL (special address) is known as NULL pointer.
- If a pointer containing NULL, we consider it as if it is not pointing to any location.
- As a safe guard to illegal use of pointers you can check for NULL before accessing pointer variable

```
int *P= NULL;
```

```
...
```

```
if (P != NULL)  
{  
    *P = 5;  
}
```

```
5
```

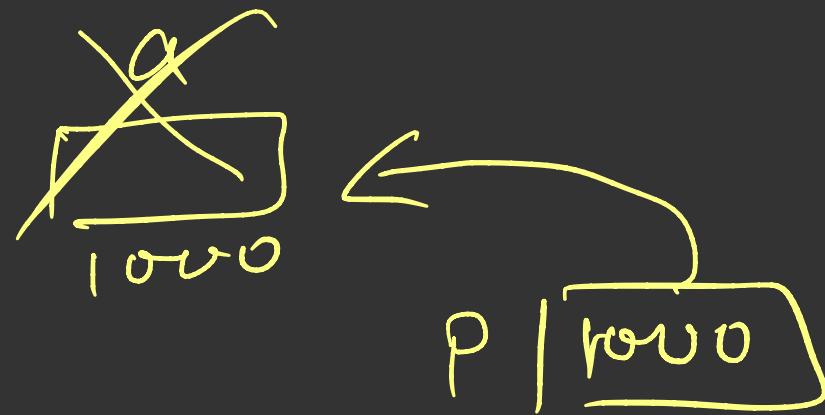

# Dangling Pointer

A pointer pointing to a memory location that has been deleted is called dangling pointer.

```
int * f1()
{
    int a;
    .....
    return &a;
}
```

```
void fun()
{
    int *P;
    P = f1();
    *P = 5;
}
```

P is dangling pointer  
illegal use of pointers

```
void f1()
{
    int *p;
    {
        int x; // Scope and life of x is
        p=&x; // limited to the block
        ...
    } // After this line
    *p=5; // p becomes dangling
           // pointer
}

```

The handwritten annotations provide additional context:

- An arrow points from the brace of the inner block to the declaration of `x`, with the text "Scope and life of `x` is limited to the block".
- An arrow points from the brace of the inner block to the assignment `p = &x;`, with the text "After this line `p` becomes dangling pointer".
- An arrow points from the assignment `*p = 5;` to the text "illegal use of pointer".

```
void f1()
{
    int *p;
    p = (int *) malloc (sizeof(int));
    ...
    ...
    free(p);  $\leftarrow$  P becomes a dangling pointer
    *p = 5;  $\leftarrow$  illegal use of pointer.
```

{}

## Void Pointer

- void pointer is a generic pointer that has no associated data type with it.
- void pointer can hold address of any type.

void *p;		void *p;
int x;		float y;
p=&x;		p=&y;

void pointers can not be dereferenced

* p = 5;		* p = 3.5f;
		
Error		

• However void pointer can be dereferenced using typecasting.

$\ast(\text{int}^*)P = 5;$

$\ast(\text{float}^*)P = 3.5f;$
